The three parent strategies mentioned in the app and in the parent videos will help get your child excited about doing science activities. What do all the strategies have in common? They are about you and your child learning together! Research shows that children who do activities with an adult often learn more than children who do an activity on their own.

1. **Play and Explore Together**
   Your attention and encouragement make a big difference!

2. **Ask Questions and Talk About Ideas**
   The more you talk together, the more your child learns.

3. **Explore More!**
   The more you do together, the more chances your child has to grow.

**Play, Talk, and Explore More!**

What young children need **more than anything else** to develop and learn is a loving parent or caretaker cheering them on! Doing the activities **together**, whether it’s watching a science video or doing a science activity with you, is how a young child learns best.

**PEEP: It takes a parent—not a scientist!**

As a parent, you don’t need to know all the answers! It’s fine to say, “I don’t know. Let’s see if we can find out together.” At this age, **exploring together** is what science is all about.
